

Climate Justice

WHAT IS IT?

Climate change is the amount of Carbon Dioxide (CO₂) in our atmosphere but we're coming to the point that we have too much CO₂ in our world. This is causing the blanket around our world (the atmosphere) to let in more of UV rays from the sun and this is affecting the weather causing more extreme condition; storms, floods etc.

WHAT IS THE ISSUE?

Rich people in Northern countries are not being affected as much as the countries in the Southern countries, for example in Pakistan and the Philippines. These countries are now experiencing more frequent floods storms and more extreme weather conditions, such as the Typhoon Hainan in the Philippines.

WHAT CAN WE DO TO CHANGE THIS?

To prevent this from happening we can start small ,like recycle and reuse the amount of of plastic and electricity in our homes .We could also cycle to travel or walk we can turn off light when not needed or not in use we could plant tree flowers etc. to take in the extra CO₂ in our world . This mean we are helping to make our world a better place. And that means if everyone pitches in we could save our world.

WHY SHOULD WE CARE?

It will not affect us but what about our grandchildren. When our grandchildren are on the earth this will cause more of an effect on the earth as the whole of the human race would probably become extinct. **So are we really doing a good job looking after our earth???**
